

Recommended Assessment

Servomotor Lab

Pulse Width Modulation (PWM)

1. When the duty cycle was set to 50% in the visualization tool, what pixel value do you expect for the gray color in Part B of the visualization?
2. As you increase or decrease the duty cycle, what pixel values did you see for the gray color in Part B of the visualization? Why?
3. Why does the section in part A flicker and differ from the average color/brightness in part B?

Driving a Servomotor

4. What was the range specification for the servomotor you used from the datasheet? Based on this, write a simple equation that represents the conversion from your user command p (0 to 1) to the corresponding servo range r used in the firmware.
5. Modify the equation from the previous example to output the servo angle θ instead of the duty cycle r based on the range of motion of your servomotor and the user command p .
6. What bias did you observe for your servomotor? Update the equation converting the user command p to a servo angle θ incorporating the bias b .
